

Lab 5 Report

Student name: 王晨雨

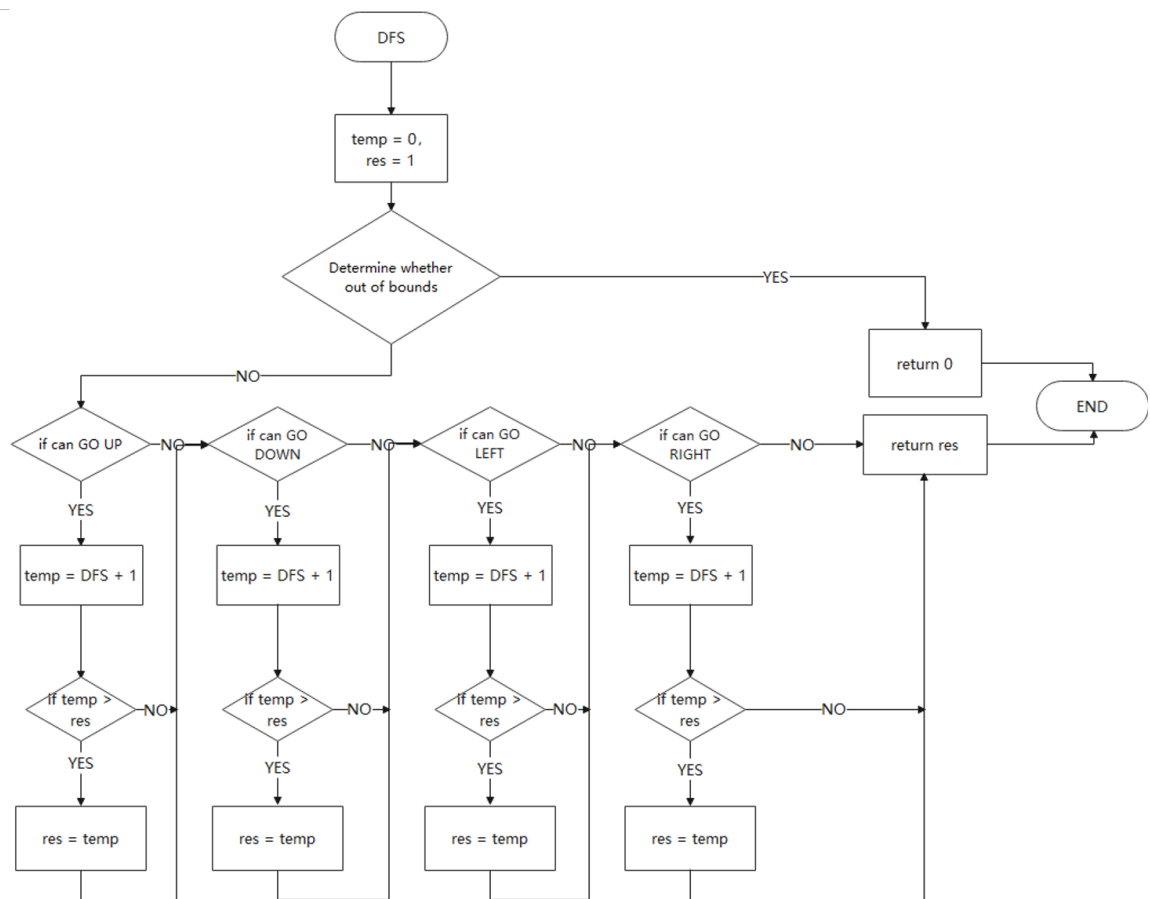

Strudent ID: 3200102324

TA Check date: 2021/7/29

Report submission date: 2021/7/29

1. Algorithm

This chart below shows the algorithm of the recursive program **DFS**

Main program use DFS to go through every point, looking for the longest path:

```
1  for(int i = 0; i < n; i++)
2  {
3      for(int j = 0; j < m; j++)
4      {
5          int tempMax = DFS(a, i, j);
6          if(tempMax > Max)
7              Max = tempMax;
8      }
9  }
```

2. Essential parts of code

For example, the following part of code shows `if(a[x][y] > a[x-1][y])`

```
1          ; Go Up: if(a[x][y] > a[x-1][y])
2  NEXT1    LDR    R2, R5, #1      ; R2 = y, R1 = x
3          LDR    R1, R5, #2
4          ADD    R1, R1, #0
5          BRz    NEXT2
6          LD     R3, BASEN      ; R3 = x4000
7          LDR    R4, R3, #1      ; R4 = m
8          JSR    MULTIPLY
9          ADD    R0, R2, R0
10         ADD    R0, R0, #2      ; R0 = x*m+y+2
11         ADD    R3, R3, R0
12         LDR    R2, R3, #0      ; R2 = a[x*m+y+2]
13         NOT    R4, R4
14         ADD    R4, R4, #1
15         ADD    R3, R3, R4
16         LDR    R1, R3, #0      ; R1 = a[(x-1)*m+y+2]
17         NOT    R1, R1
18         ADD    R1, R1, #1
19         ADD    R1, R2, R1
20         BRnz   NEXT2
21
22         LDR    R2, R5, #1      ; R2 = y, R1 = x-1
23         LDR    R1, R5, #2
24         ADD    R1, R1, #-1
25         ADD    R6, R6, #-2      ; Push arguments
26         STR    R1, R6, #1
27         STR    R2, R6, #0
28         JSR    DFS
29
30         LDR    R3, R5, #-3      ; R3 = res, R4 = temp
31         ADD    R4, R4, #1
32         ADD    R0, R4, #0      ; R0 = R4
33         NOT    R4, R4
34         ADD    R4, R4, #1
35         ADD    R4, R3, R4      ; R4 = res-temp
36         BRzp   NEXT2
37         ADD    R3, R0, #0      ; res = temp
38         ADD    R4, R3, #0
39         STR    R4, R5, #-3
```

The loop to find longest path:

```
1          ; Find the maximum
2          LD     R3, BASEN
3          LDR    R1, R3, #0      ; R1 = n-1
4  OUTERLOOP ADD    R1, R1, #-1
5          BRn    TERMINATE
6          LD     R3, BASEN
7          LDR    R2, R3, #1      ; R2 = m-1
8
9  INNERLOOP ADD    R2, R2, #-1
10         BRn    OUTERLOOP
11         ; Push arguments
```

```

12      ADD    R6, R6, #-2
13      STR    R1, R6, #1
14      STR    R2, R6, #0
15      ST     R0, SaveR0
16      ST     R1, SaveR11
17      ST     R2, SaveR22
18      JSR    DFS
19      LD     R0, SaveR0
20      LD     R1, SaveR11
21      LD     R2, SaveR22
22      ADD    R3, R4, #0      ; R3 = R4
23      NOT    R4, R4
24      ADD    R4, R4, #1
25      ADD    R4, R0, R4      ; R4 = Max-tempMax
26      BRz    INNERLOOP
27      ADD    R0, R3, #0      ; Max = tempMax
28      BR     INNERLOOP

```

3. TA's questions

TA: Explain the procedure to write a recursive program.

Answer:

- Push arguments into stack
- Push control link stack
- Push return address into stack
- Push temporary variables
- (main body of subroutine)
- Pop the return address
- return

TA: How to judge the boundaries?

Answer:

- judge if $x < 0$ or $x \geq n$ or $y < 0$ or $y \geq m$

```

1  if(x < 0 || x >= n || y < 0 || y >= m)
2  return 0

```
